Chapter 1 – INTRODUCTION & EXISTING CONDITIONS

PART A – INTRODUCTION

At the request of the City of Asbury, MSA Professional Services (MSA) has conducted a traffic study for a portion of the Asbury Road corridor. Asbury Road is the primary east-west corridor through the City of Asbury (City), as shown in Figure 1-1.

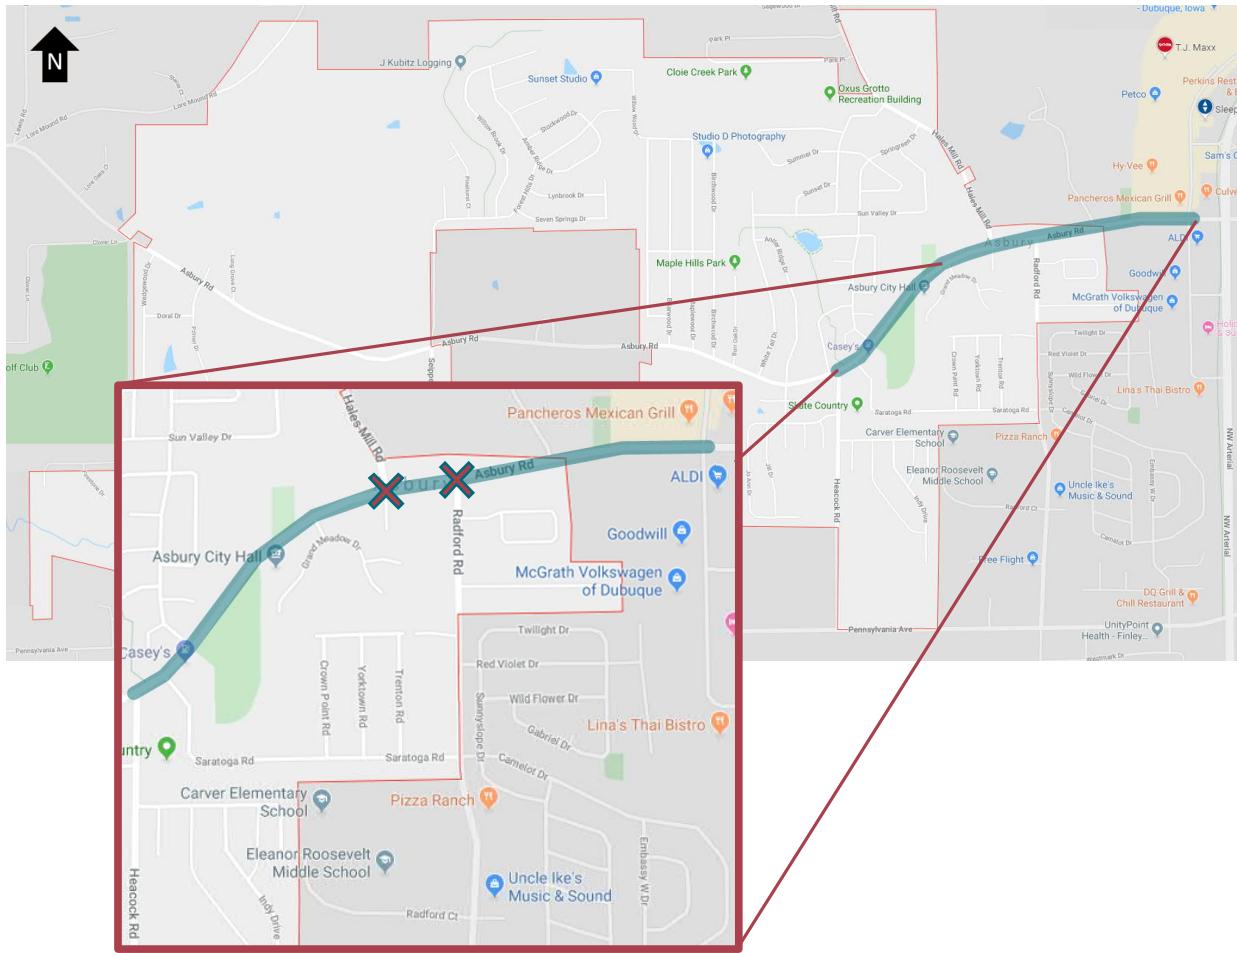

Figure 1-1, City of Asbury and Asbury Road corridor overview

The limits of the original study were from Heacock Road on the western end to Holiday Drive on the eastern end, as highlighted in Figure 1-1. After further review and discussion with the City, the focus of the study was narrowed to a portion of Asbury Road between the intersections with Hales Mill Road and Radford Road, denoted by the 'X's in Figure 1-1. The corridor experiences significant congestion during the peak hours, with queues that back into adjacent intersections and block numerous driveways, in addition to exceeding the dedicated storage at Radford Road. The poor operations cause drivers to accept smaller gaps, which create additional safety issues.

PART B – EXISTING CONDITIONS

Asbury Road is a two-lane urban roadway with a center two-way left-turn lane (TWLTL) and a posted speed of 35-mph.

B1. Hales Mill Road

Hales Mill Road is an urban two-lane roadway with a posted speed of 35-mph. At the intersection with Asbury Road, it widens to include a dedicated left and right turn lane, with an approximate turn lane lengths of 150-feet. The TWLTL along Asbury Road transitions into a dedicated eastbound left-turn lane with an approximate turn lane length of 50-feet. The intersection with Asbury Road is controlled by a stop sign on Hales Mill Road, a one way stop control (OWSC).

B2. Radford Road

Radford Road is an urban two-lane roadway with bike lanes in both directions and a posted speed of 35-mph. At the intersection with Asbury Road, it widens to include a dedicated left and right turn lane, with an approximate turn lane length of 150-feet. The TWLTL along Asbury Road transitions into a dedicated westbound left-turn lane with an approximate turn lane length of 75-feet. The intersection with Asbury Road is controlled by a OWSC, with Radford Road stopping.

PART C - TRAFFIC

Traffic counts were collected at the study intersections on Wednesday, May 15th, 2019. Twelve-hours of traffic volumes were collected at each of the study intersections, in order to cover the peak hours (7 – 8 AM, noon – 1 PM, and 4 – 5 PM) and cover the required number of hours to complete traffic signal warrants. Full traffic volume data is included in Appendix A.

To account for growth and analyze future traffic needs, background volumes were grown linearly from the 2019 counts. Growth rates were established based on data provided by the East Central Intergovernmental Association (ECIA). The following rates were used:

Asbury Road	
West of Radford Road	1.5%
Radford Road – Holiday Drive	1.0%
Hales Mill Road	3.0%
Radford Road	0.5%

Growth horizons of 2029 and 2039 were used to assess future conditions. Forecasted traffic counts are included in Appendix A.

PART D - CRASHES

MSA worked with ECIA to gather crash data for the corridor. Per communications received from ECIA, the number of crashes that have occurred is low and would not be high enough to trigger any safety-based projects or funding. Based on that information, no further safety analysis was completed.

PART E – OPERATIONAL ANALYSIS

Traffic volumes were analyzed using Synchro/SimTraffic 10 software, utilizing Highway Capacity Manual (HCM) 6th Edition thresholds. Queue lengths are reported at the 95th percentile. Full operational output is included in Appendix B. This type of analysis assigns a Level of Service (LOS) to each movement or lane, depending on the geometric configuration. LOS is a quantitative measure that refers to the overall quality of flow at an intersection ranging from very good, LOS "A," to very poor, LOS "F," as shown in MSA Professional Services, Inc.

Table 1-1. The delay is measured in seconds per vehicle, which can be used to determine the LOS for the intersection. LOS is not necessarily tied solely to delay. Since an intersection has other influences outside the method of control, other factors may cause excessive congestion. In cases where there is excessive congestion not directly correlated to the control method of the intersection, the approach will automatically be assigned LOS F.

Table 1-1, HCM LOS Definitions

LOS	Unsignalized	Signalized
	Average Control Delay (seconds/vehicle)	Average Control Delay (seconds/vehicle)
A "best"	0–10	0–10
B	>10–15	>10–20
C	>15–25	>20–35
D	>25–35	>35–55
E	>35–50	>55–80
F "worst"	>50	>80

E1. 2019 Traffic Volumes

Table 1-2 shows a summary of the traffic analysis results for the 2019 volumes with the existing corridor geometries. Both intersections are unsignalized, with stop control on the side streets (Radford Road, Hales Mills Road).

Table 1-2, 2019 Existing Operations, Existing Configuration

Intersection	Peak Hour	Parameters	West Approach			East Approach			South Approach			North Approach			
			LT	TH	RT	LT	TH	RT	LT	TH	RT	LT	TH	RT	
Radford Road	AM	Lanes	1-Shared			1	1		1	1					
		LOS	A			B	A		F		F				
		Delay (s)	0.0			13.1	0.0		75.8		81.1				
	PM	Queue (ft)	0			25	0		25	225					
		LOS	A			A	A		F	C					
		Delay (s)	0.0			9.8	0.0		81.4	19.0					
Hales Mill Road	AM	Queue (ft)	0			25	0		25	75					
		Lanes	1	1		1-Shared				1	1				
		LOS	A	A		A				F	A				
	PM	Delay (s)	7.9	0.0		0.0				141.2	9.9				
		Queue (ft)	0	0		0				325	25				
		LOS	A	A		A				F	B				
		Delay (s)	9.7	0		0.0				60.2	14.1				
		Queue (ft)	25	0		0				100	25				

LOS source: HCM 6th Edition, Unsignalized Intersections

Queue represents 95th percentile queue per lane, 25-feet per vehicle

Asbury Road at Radford Road

As shown in Table 1-2, the lanes of the northbound approach operate at LOS F in the AM peak hour; the left lane operates at LOS F in the PM peak hour.

Asbury Road at Hales Mill Road

The left lane of the southbound approach operates at LOS F for both peak hours.

For both intersections, the delays on the stop controlled side road are excessive and require intersection improvements to operate at an acceptable level.

E2. 2029 Traffic Volumes

Table 1-3 shows a summary of the traffic analysis results for the 2029 volumes with the existing corridor geometries. Both intersections are unsignalized, with stop control on the side streets (Radford Road, Hales Mills Road). The operations were showing unacceptable LOS and delay for the stop-controlled side roads for the 2019 analysis and further deterioration occurs quickly if not addressed.

Table 1-3, 2029 Projected Operations, Existing Configuration

Intersection	Peak Hour	Parameters	West Approach			East Approach			South Approach			North Approach		
			LT	TH	RT	LT	TH	RT	LT	TH	RT	LT	TH	RT
Radford Road	AM	Lanes	1-Shared			1	1		1	1				
		LOS	A			C	A		F		F			
		Delay (s)	0.0			16.3	0.0		157.6		202.6			
	PM	Queue (ft)	0			50	0		25	375				
		LOS	A			B	A		F		C			
		Delay (s)	0.0			10.6	0.0		148.4		24.6

LOS source: HCM 6th Edition, Unsignalized Intersections

Queue represents 95th percentile queue per lane, 25-feet per vehicle

Chapter 2 – RADFORD ROAD INTERSECTION ALTERNATIVE DEVELOPMENT

Initial focus was placed on correcting operational issues at the Radford Road intersection with Asbury Road. This intersection was the initial focus, due to proposed development north of the intersection.

PART A – METHODOLOGY

Several alternatives were identified as potential options to improve operations at the Radford Road intersection:

- Alternative 1: Traffic signal with existing lanes/geometry
- Alternative 2: Traffic signal with two eastbound lanes
- Alternative 3: Mini roundabout
- Alternative 4: Single-lane roundabout
- Alternative 5: Multilane roundabout

These alternatives were first analyzed at the Asbury Road at Radford Road intersection for the 2019, 2029, and 2039 horizons. If the alternative did not operate at acceptable levels in a horizon year subsequent horizon years were not evaluated.

Traffic volumes for signalized intersection controls were analyzed using Synchro/SimTraffic 10 software, utilizing HCM 6th Edition thresholds. Queue lengths are reported at the 95th percentile. For roundabout alternatives, ARCADY software was used, with HCM 6th Edition LOS thresholds and 95th percentile queues. SIDRA and HCS software was used for comparison purposes. SIDRA analyses were completed with HCM 6th Edition thresholds but without geometric delay parameters. The SIDRA computational engine was used to establish delay and queue results. HCS was used when possible, as HCS is not currently capable of mini roundabout analysis. SIDRA and HCS roundabout results are included in Appendix C.

Full operational analysis results are included in Appendix C.

PART B – ALTERNATIVE ANALYSIS

B1. Alternative 1, Traffic Signal with Existing Lanes/Geometry

This alternative would add traffic signal controls to the intersection of Asbury Road at Radford Road, while maintaining the existing pavement and lane configurations. No geometric or operational improvements would be realized at the Hales Mill Road intersection under this alternative.

A summary of the operational analysis is shown in Table 2-1.

Table 2-1, Projected Operations, Existing Configuration with Traffic Signals at Radford Road

Year	Peak Hour	Parameters	West Approach			East Approach			South Approach		
			LT	TH	RT	LT	TH	RT	LT	TH	RT
2019	AM	Lanes	1-Shared			1	1		1	1	
		LOS	C			D	A		C	D	
		Delay (s)	32.4			36.0	4.1		32.4	53.0	
	PM	Queue (ft)	800			175	75		25	150	
		LOS	C			B	B		B	B	
		Delay (s)	21.2			11.6	10.2		17.6	16.5	
		Queue (ft)	350			50	300		25	50	
2029	AM	Lanes	1-Shared			1	1		1	1	
		LOS	F	E			E	A	D	E	
		Delay (s)		47.4			75.1	2.6	50.8	77.4	
		Queue (ft)		1200			275	75	25	225	
	PM	LOS	C			B	B		C	C	
		Delay (s)	24.0			14.4	12.4		20.1	20.5	
		Queue (ft)	450			75	400		25	75	

LOS source: HCM 6th Edition, Signalized Intersections
Queue represents 95th percentile queue per lane, 25-feet per vehicle

Under existing 2019 traffic, all approaches are expected to operate at LOS D or better in the AM peak hour. Expected eastbound queues would reach 800-feet, during this peak hour, which would extend several hundred feet beyond the Hales Mill Road intersection. All approaches are expected to operate at LOS C or better in the PM peak hour. Expected eastbound queues would still reach the Hales Mill Road intersection.

Using projected 2029 traffic, the eastbound approach is expected to operate at LOS F and overcapacity during the AM peak hour. The left lane of the westbound approach and the right lane of the northbound approach is expected to operate at LOS E. The right lane of the westbound approach is expected to operate at LOS A; the left lane of the northbound approach is expected to operate at LOS D during the AM peak hour. Expected eastbound queues would reach 1,200-feet, during this peak hour, which would extend several hundred feet upstream of the Hales Mill Road intersection. All approaches are expected to operate at LOS C or better in the PM peak hour. Expected eastbound queues would still reach the Hales Mill Road intersection.

B2. Alternative 2, Traffic Signal with Two Eastbound Lanes

This alternative would add traffic signal controls to the intersection of Asbury Road at Radford Road, as well as an additional eastbound through lane. The additional lane would begin downstream of the Hales Mill Road intersection; therefore, the lane addition would have negligible impact on operations at the Asbury Road at Hales Mill Road intersection. A lane schematic of this improvement alternative is shown in Figure 2-1.

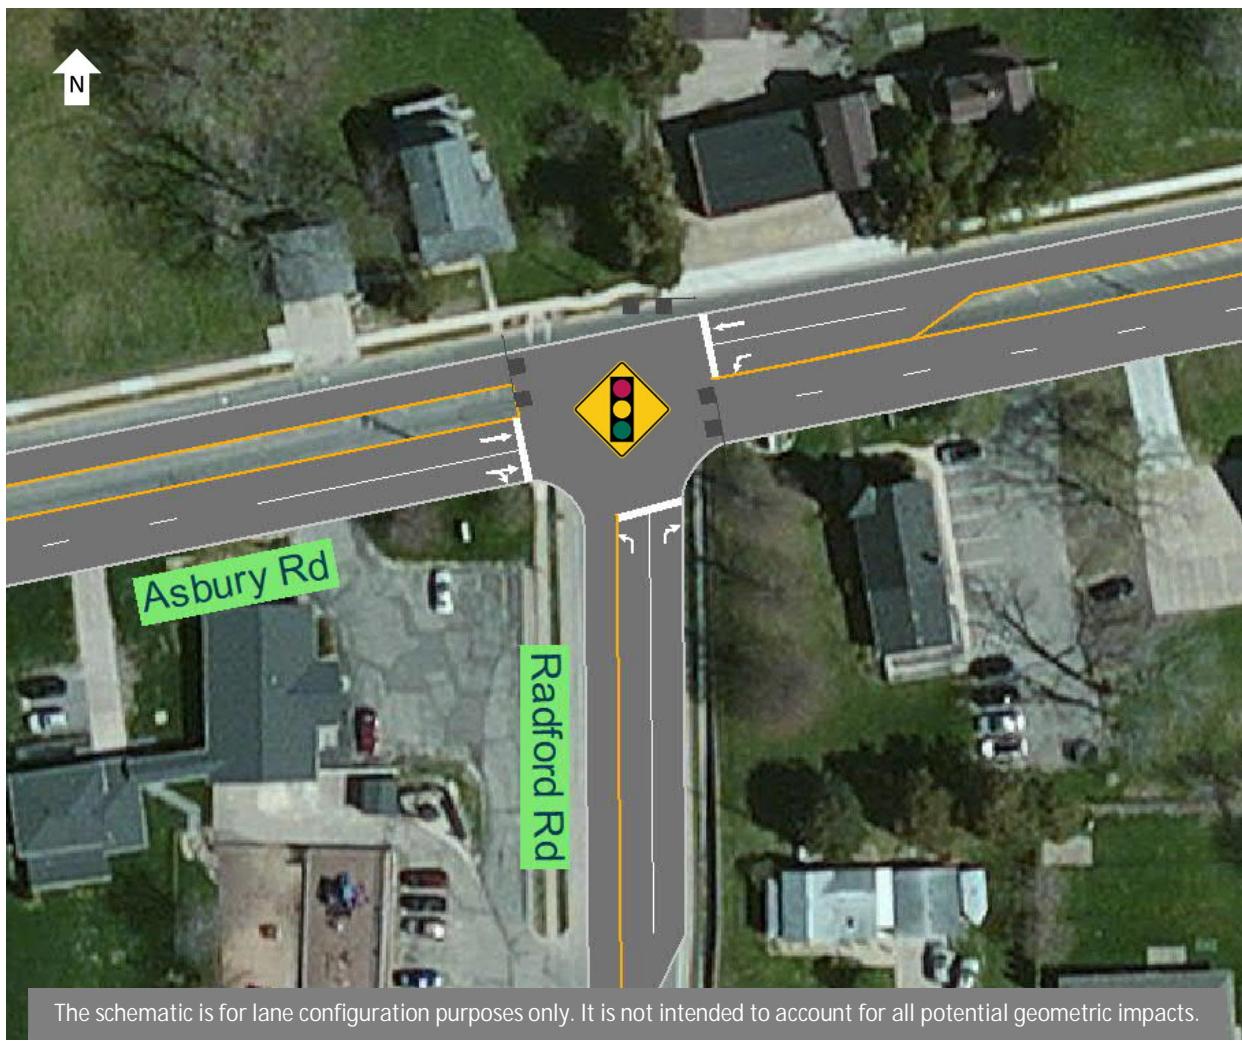

Figure 2-1, Traffic Signal with two eastbound lanes at Radford Road

A summary of the operational analysis is shown in Table 2-2.

Table 2-2, Projected Operations, Two Eastbound Lanes with Traffic Signals at Radford Road

Year	Peak Hour	Parameters	West Approach			East Approach			South Approach		
			LT	TH	RT	LT	TH	RT	LT	TH	RT
2019	AM	Lanes	1 TH, 1 TH/RT			1	1		1	1	
		LOS	B	B		B	A		B	C	
		Delay (s)	17.7	17.6		10.5	5.3		19.4	24.7	
	PM	Queue (ft)	225	225		75	75		25	100	
		LOS	B	B		A	B		B	B	
		Delay (s)	13.8	13.8		8.7	12.6		14.9	13.2	
		Queue (ft)	125	125		50	300		25	50	
2029	AM	Lanes	1 TH, 1 TH/RT			1	1		1	1	
		LOS	C	C		B	A		B	C	
		Delay (s)	22.5	22.3		13.5	5.5		19.5	21.6	
	PM	Queue (ft)	275	275		100	75		25	125	
		LOS	B	B		A	B		B	B	
		Delay (s)	12.1	12.1		8.1	11.2		19.1	19.0	
		Queue (ft)	150	150		50	375		25	75	
2039	AM	Lanes	1 TH, 1 TH/RT			1	1		1	1	
		LOS	C	C		B	A		C	C	
		Delay (s)	21.8	21.8		18.1	5.0		23.6	31.4	
	PM	Queue (ft)	375	375		125	100		25	150	
		LOS	B	B		A	B		C	C	
		Delay (s)	11.4	11.4		8.0	13.5		23.7	26.2	
		Queue (ft)	175	175		50	500		25	125	

LOS source: HCM 6th Edition, Signalized Intersections
Queue represents 95th percentile queue per lane, 25-feet per vehicle

Under existing 2019 and projected 2029 traffic, all approaches are expected to operate at LOS C or better in both peak hours.

Using projected 2039 traffic, all approaches are expected to operate at LOS C or better in both peak hours. Expected eastbound queues would reach 375-feet, during this peak hour, which would begin to encroach on the Hales Mill Road intersection.

B3. Alternative 3, Mini Roundabout

This alternative would convert the existing intersection of Asbury Road at Radford Road into a mini roundabout. A mini roundabout is smaller than a traditional roundabout with a circle diameter of 90 – 110-feet, with a central island that is fully traversable to allow truck movements. No geometric improvements would be completed at the Hales Mill Road intersection under this alternative; however, minor operational changes may be noticed.

Table 2-3 shows the traffic analyses for the 2019 volumes.

Table 2-3, 2019 Projected Operations, Mini Roundabout at Radford Road

Year	Peak Hour	Parameters	West Approach			East Approach			South Approach		
			LT	TH	RT	LT	TH	RT	LT	TH	RT
2019	AM	Lanes	1-Shared			1-Shared			1-Shared		
		LOS	F			A			B		
		Delay (s)	81.1			7.1			12.3		
	PM	Queue (ft)	1950			50			100		
		LOS	B			F			A		
		Delay (s)	10.9			150.2			7.7		
Queue represents 95 th percentile queue per lane, 25-feet per vehicle											

Under existing traffic, the eastbound approach is expected to operate at LOS F, with a queue that would extend over a thousand feet beyond the Hales Mill Road intersection, in the AM peak hour. All other approaches are expected to operate at LOS B or better for the AM peak hour. The westbound approach is expected to operate at LOS F and overcapacity in the PM peak hour. All other approaches are expected to operate at LOS B or better in the PM peak hour.

B4. Alternative 4, Single-lane Roundabout

This alternative would convert the existing intersection of Asbury Road at Radford Road into a single-lane roundabout. Due to the larger size of approximately 120 – 140-feet diameter, single-lane roundabouts are better able to accommodate traffic than mini roundabouts. No geometric improvements would be completed at the Hales Mill Road intersection under this alternative; however, minor operational changes may be noticed.

Table 2-4 shows the traffic analyses for the 2019 volumes.

Table 2-4, 2019 Projected Operations, Single-lane Roundabout at Radford Road

Year	Peak Hour	Parameters	West Approach			East Approach			South Approach		
			LT	TH	RT	LT	TH	RT	LT	TH	RT
2019	AM	Lanes	1-Shared			1-Shared			1-Shared		
		LOS	F			A			B		
		Delay (s)	52.8			6.2			11.2		
	PM	Queue (ft)	1625			50			100		
		LOS	A			F			A		
		Delay (s)	9.8			75.6			7.1		
Queue represents 95 th percentile queue per lane, 25-feet per vehicle											

Under existing traffic, the eastbound approach is expected to operate at LOS F, with a queue that would extend several hundred feet upstream of the Hales Mill Road intersection, in the AM peak hour. All other approaches are expected to operate at LOS B or better for the AM peak hour. The westbound

approach is expected to operate at LOS F. All other approaches are expected to operate at LOS A in the PM peak hour.

B5. Alternative 5, Multilane Roundabout

This alternative would convert the existing intersection of Asbury Road at Radford Road into a multilane roundabout. Existing eastbound and westbound lanes along Asbury Road would flare from one lane into two lanes upstream of the proposed roundabout. The lanes would merge back to one lane downstream of the roundabout. No geometric improvements would be completed at the Hales Mill Road intersection under this alternative; however, minor operational changes may be noticed. A lane schematic of this improvement alternative is shown in Figure 2-2.

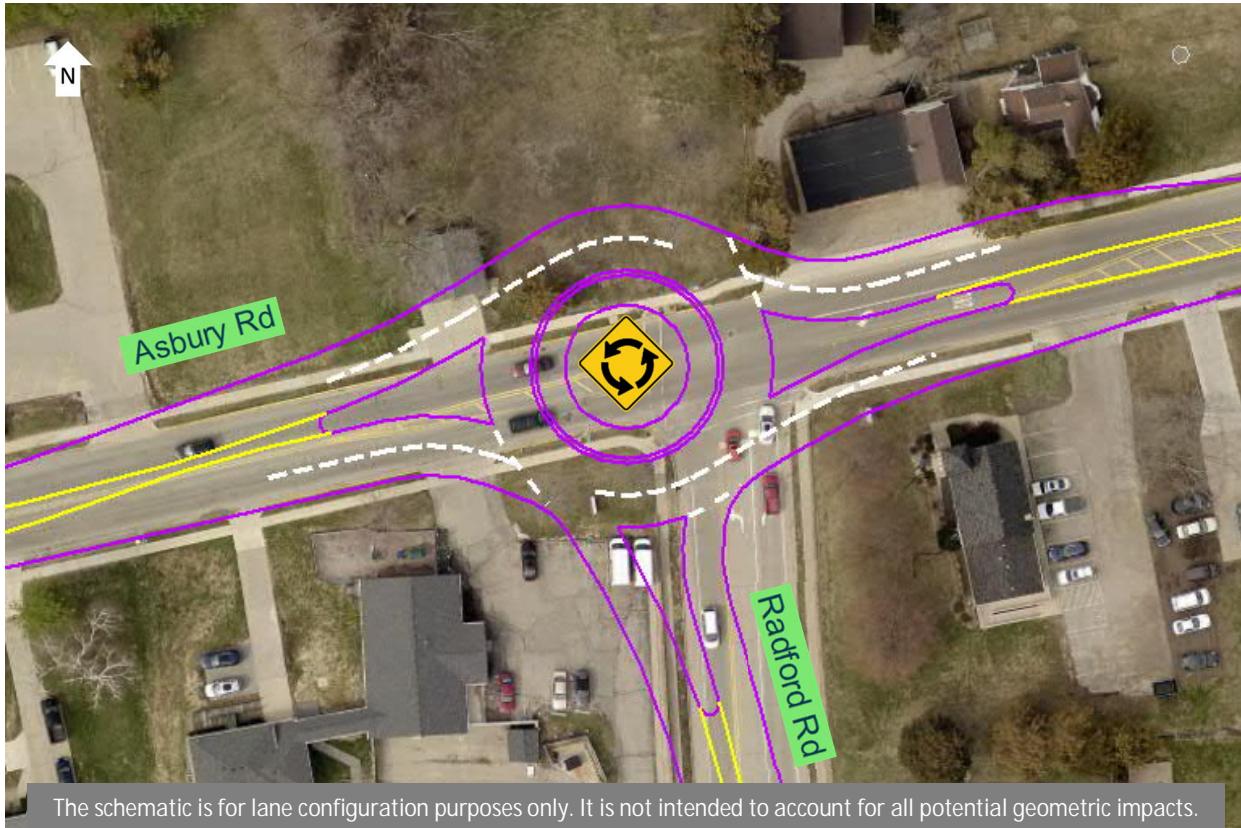

Figure 2-2, Multilane roundabout at Radford Road

A summary of the operational analysis is shown in Table 2-5.

Table 2-5, Projected Operations, Multilane Roundabout at Radford Road

Year	Peak Hour	Parameters	West Approach			East Approach			South Approach		
			LT	TH	RT	LT	TH	RT	LT	TH	RT
2019	AM	Lanes	1 TH, 1 TH/RT			1 LT/TH, 1 TH			1-Shared		
		LOS	A	A		A	A		B		
		Delay (s)	5.3	5.3		2.9	2.9		10.7		
	PM	Queue (ft)	25	25		25	25		100		
		LOS	A	A		A	A		A		
		Delay (s)	3.6	3.6		5.2	5.2		6.8		
		Queue (ft)	50	50		50	50		75		
2029	AM	Lanes	1 TH, 1 TH/RT			1 LT/TH, 1 TH			1-Shared		
		LOS	A	A		A	A		B		
		Delay (s)	6.3	6.3		2.8	2.8		12.5		
	PM	Queue (ft)	50	50		25	25		100		
		LOS	A	A		A	A		A		
		Delay (s)	3.7	3.7		5.7	5.7		6.9		
		Queue (ft)	25	25		50	50		75		
2039	AM	Lanes	1 TH, 1 TH/RT			1 LT/TH, 1 TH			1-Shared		
		LOS	A	A		A	A		C		
		Delay (s)	9.8	9.8		3.0	3.0		20.7		
	PM	Queue (ft)	175	175		50	50		200		
		LOS	A	A		A	A		A		
		Delay (s)	4.4	4.4		7.6	7.6		8.3		
		Queue (ft)	25	25		100	100		75		

LOS source: HCM 6th Edition, Unsignalized Intersections
Queue represents 95th percentile queue per lane, 25-feet per vehicle

Under existing 2019 and projected 2029 traffic, all approaches are expected to operate at LOS B or better for both peak hours. Using projected 2039 traffic, all approaches are expected to operate at LOS C or better for both peak hours.

PART C – ALTERNATIVES DISCUSSION

Alternatives that failed to improve operations to an acceptable level (LOS D or better) through the 2029 design year and/or did not reduce queue spillback from the Radford Road intersection into the Hales Mill Road intersection were removed from further analysis consideration. Based on these criteria, the following alternatives will not be considered viable and will not be analyzed any further:

- Alternative 1: Traffic Signal with Existing Lanes/Geometry
- Alternative 3: Mini Roundabout
- Alternative 4: Single-lane Roundabout

The following intersection alternatives are projected to improve operations to an acceptable level, and will be considered for further analysis:

- Alternative 2: Traffic Signal with Two Eastbound Lanes
- Alternative 5: Multilane Roundabout.

Chapter 3 – HALES MILL ROAD INTERSECTION ALTERNATIVE DEVELOPMENT

Since the Radford Road at Asbury Road intersection has lower volumes than the Asbury Road at Hales Mill Road intersection, it was assumed that any Radford Road intersection alternative that did not operate at acceptable levels would not operate better at the Hales Mill Road intersection. Therefore, scenarios were not reanalyzed for the Hales Mill Road intersection, knowing that improvements that are more substantial would be necessary in order to improve operations. Since the alternatives that were acceptable to move forward for further consideration at Radford Road were all significant improvements that would require substantial planning by the City, the study next focused on some possible short term and long-term improvements for both intersections.

Chapter 4 – SHORT-TERM & LONG-TERM CORRIDOR ALTERNATIVES

PART A – ALTERNATIVE REFINEMENT

Since the alternatives that were acceptable to move forward for further consideration at Radford Road were all significant improvements that would require substantial planning by the City, the study next focused on some possible short term and long term improvements for both intersections. Short term improvements that were low in cost but would improve operations for 5-10 years were analyzed and larger improvements such as those described in Chapter 2 for Asbury Road were investigated. Based on those criteria, the following alternatives were investigated further:

Short-Term

- Traffic Signal at Hales Mill Road with Minor Geometric Improvements
- Traffic Signals at Both Intersections with Existing Lanes/Geometry

Long-Term

- Two Eastbound Lanes on Asbury Road with
 - Traffic Signal at Hales Mill Road
 - Traffic Signal at Radford Road
 - Traffic Signal at Both Intersections
- Realign Hales Mill Road and Radford Road into One Intersection with
 - Multilane Roundabout
 - Traffic Signal with Two Eastbound Lanes on Asbury Road

Traffic volumes for signalized intersection controls were analyzed using Synchro/SimTraffic 10 software, utilizing HCM 6th Edition thresholds. Queue lengths are reported at the 95th percentile. For roundabout alternatives, ARCADY software was used, with HCM 6th Edition LOS thresholds and 95th percentile queues. Full operational analysis results are included in Appendix D.

PART B – SHORT-TERM ALTERNATIVE ANALYSIS

Short-term alternatives are intended to be changes that could be made for a lower cost, would have a lower geometric impact, but would only improve the operations for a short time, likely less than 10-years. These alternatives could also be implemented in a relatively quick timeframe. They are not intended to be complete solutions to all corridor issues, and would likely require addition work within the next 10-years.

B1. Alternative ST1, Traffic Signal at Hales Mill Road with Minor Geometric Improvements

This alternative would add traffic signal controls to the intersection of Asbury Road at Hales Mill Road, as well as a westbound right-turn lane. In Chapter 3, it was stated that a signal with little geometric improvements was not analyzed at this intersection, since it would likely not operate better than a similar improvement at Radford Road as analyzed in Chapter 2. However, many of the operational issues experienced with the Radford Road signal alternative included queues for eastbound traffic that extended through the Hales Mill Road intersection; therefore, causing increased problems at the Hales Mill Road intersection. By instead adding the signal at Hales Mill Road as a short-term solution, the queues would still be expected to be extensive but they would not interfere with adjacent intersections. Since this analysis was focused on incremental improvements for both intersections, an extension of the

westbound left-turn lane to 300-feet at Radford Road is also recommended to be included. A lane schematic of this improvement alternative is shown in Figure 4-1 and Figure 4-2.

Figure 4-1, Traffic Signal with westbound right-turn lane at Hales Mill Road

Figure 4-2, Extension of westbound left-turn lane at Radford Road

The addition of the westbound right-turn lane at the Hales Mill Road intersection and the extension of the westbound left-turn lane at the Radford Road intersection are expected to increase capacity and improve safety by removing slower traffic from the through-lanes of traffic.

A traffic signal warrant analysis was completed for the intersection of Hales Mills Road at Asbury Road, using 2019 traffic count data. The Manual on Uniform Traffic Control Devices (MUTCD) contains nine warrants that can be utilized to support the installation of a traffic signal:

- Warrant 1, Eight-Hour Vehicular Volume
- Warrant 2, Four-Hour Vehicular Volume
- Warrant 3, Peak Hour
- Warrant 4, Pedestrian Volume
- Warrant 5, School Crossing
- Warrant 6, Coordinated Signal System
- Warrant 7, Crash Experience
- Warrant 8, Roadway Network
- Warrant 9, Intersection Near a Grade Crossing

The warrant analyses focused on the volume-based warrants: Warrants 1 and 2. Warrant 3 can be another warrant of volume-based focus; however, use of that warrant is reserved for developments that attract or discharge a large number of vehicles in a short period of time (e.g., schools, manufacturing/industrial complexes). Since there is no proposed development that will not include those land uses, Warrant 3 was not investigated.

The traffic signal warrant analyses were performed using the 100-percent volume thresholds, given the 35-mph posted speed limit of Asbury Road. Right-turn volumes were only included for the westbound approach (at 100-percent inclusion), as the southbound approach has a separate lane for right-turning traffic. Right-turning traffic is generally not included when a separate and/or channelized right-turn lane is present.

Based on this analysis, no signal warrants are currently met; however, volumetric warrants may be met if any new development occurs near the intersection as the numbers are very close to meeting the Warrant 1, Condition B.

While warrants are not met, a change in traffic control is the only alternative that would have the ability to improve operations. Additional lanes along Hales Mill Road would not be feasible and an all-way stop control (AWSC) would only further degrade operations along Asbury Road. The full traffic signal warrant analysis is included in Appendix E.

Table 4-1 shows the traffic analysis for the projected 2029 volumes.

Table 4-1, 2029 Projected Operations, Traffic Signal at Hales Mill Road with Minor Geometric Improvements

Intersection	Peak Hour	Parameters	West Approach			East Approach			South Approach			North Approach		
			LT	TH	RT	LT	TH	RT	LT	TH	RT	LT	TH	RT

¹ LOS source: HCM 6th Edition, Unsignalized Intersections

² LOS source: HCM 6th Edition, Signalized Intersections

Queue represents 95th percentile queue per lane, 25-feet per vehicle

Under projected traffic for 2029, all approaches are expected to operate at LOS C or better in both peak hours at the Hales Mill Road intersection. The eastbound approach is nearing capacity in the AM peak hour.

Expected operations at the Radford Road see slight improvements, but not enough to appreciably change the poor operations for the Radford Road approach. Depending on the ultimate timing of the proposed signal, additional benefits may be observed at the Radford Road intersection due to the ability to create gaps in traffic along Asbury Road.

B2. Alternative ST2, Traffic Signals at Both Intersections with Existing Lanes/Geometry

This alternative would add traffic signal controls to both the Hales Mill Road and Radford Road intersections with Asbury Road. Due to the proximity of the intersections, both signals would need to operate in a coordinated fashion. The signal phasing includes protected/permissive left-turns along Asbury Road. No geometric lane changes are proposed as part of this alternative. A lane schematic of this improvement alternative is shown in Figure 4-3.

Figure 4-3, Traffic Signals at both intersections with existing lanes/geometry

Table 4-2 shows the traffic analysis for the projected 2029 volumes.

Table 4-2, 2029 Projected Operations, Traffic Signal at Both Intersections with Existing Lanes/Geometry

			25			600						200	25		

LOS source: HCM 6th Edition, Signalized Intersections

Queue represents 95th percentile queue per lane, 25-feet per vehicle

* LOS F due to operations exceeding capacity (excessive queue shown)

Under projected traffic for 2029 at the Radford Road intersection, all approaches are expected to operate at LOS D or better for both peak hours, except for the eastbound approach and westbound left lane (LOS F), and the northbound right lane (LOS E) in the AM peak hour. Expected eastbound queues would reach 1,150-feet, during this peak hour, which would extend several hundred feet upstream of the Hales Mill Road intersection.

At the Hales Mill Road intersection, all approaches are expected to operate at LOS B or better in both peak hours, except for the southbound left and right lanes. The southbound left lane is expected to operate at LOS D in the AM peak hour and LOS E in the PM peak hour. The southbound right lane is expected to operate at LOS D in both peak hours.

The additional signal at the Radford Road intersection improves the operations for those on Radford Road, but similar to the results from Chapter 2, there is excessive queuing west that will cause problems at the Hales Mill Road intersection.

PART C – LONG-TERM ALTERNATIVES

Long-term alternatives are intended to be changes that would have higher costs, due to larger geometric impacts and subsequent impact to a longer stretch of the Asbury Road corridor, not just the two study intersections. However, these alternatives would target the 2029 horizon year and beyond.

C1. Alternative LT1, Two Eastbound Lanes on Asbury Road

C1-1. Traffic Signal at Hales Mill Road

This alternative would add traffic signal controls to the intersection of Asbury Road at Hales Mill Road, in addition to the second eastbound lane along Asbury Road through both study intersections. The Radford Road intersection would remain with its current one-way stop control. A lane schematic of this improvement alternative is shown in Figure 4-4.

Figure 4-4, Traffic signal at Hales Mill Road with two eastbound lanes on Asbury Road

Table 4-3 shows the traffic analysis for the projected 2029 volumes.

Table 4-3, 2029 Projected Operations, Traffic Signal at Hales Mill Road Intersection with Two Eastbound Lanes on Asbury Road

Intersection	Peak Hour	Parameters	West Approach			East Approach			South Approach			North Approach		
			LT	TH	RT	LT	TH	RT	LT	TH	RT	LT	TH	RT
Radford Road ¹	AM	Lanes	1 TH, 1 TH/RT			1	1		1	1				
		LOS	A	A		C	A		F		D			
		Delay (s)	0.0	0.0		16.5	0.0		186.1		28.8

		Lanes	1	1		1-Shared						1	1	
		LOS	A	B		A						C	B	
	PM	Delay (s)	9.6	20.0		7.5						27.2	15.2	
		Queue (ft)	25	550		150						250	25	
		LOS	C	A		B						C	B	
		Delay (s)	20.3	5.9		15.1						21.4	18.9	
		Queue (ft)	25	175		575						100	25	

¹ LOS source: HCM 6th Edition, Unsignalized Intersections

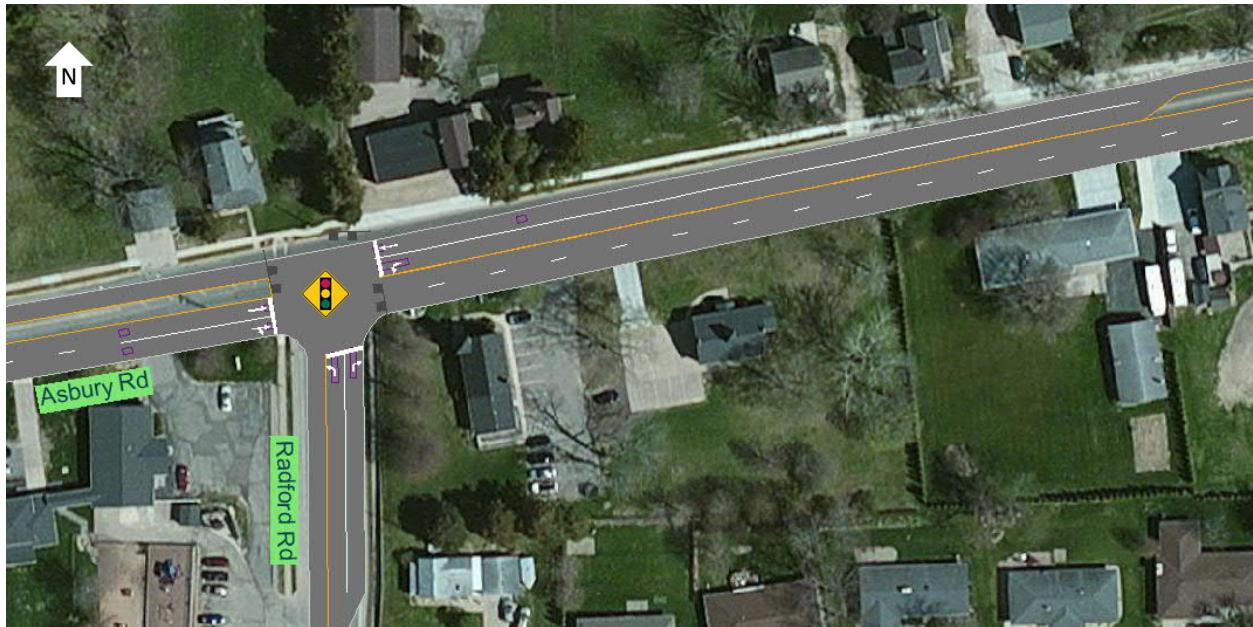

² LOS source: HCM 6th Edition, Signalized Intersections

Queue represents 95th percentile queue per lane, 25-feet per vehicle

Under projected traffic for 2029, all approaches are expected to operate at LOS C or better in both peak hours at the Hales Mill Road intersection. Expected operations at the Radford Road intersection likely will see slight improvements, but not enough to effectively improve the poor operations along Radford Road. Depending on the ultimate timing of the proposed signal, additional benefits may be observed at the Radford Road intersection, due to the ability to create gaps in traffic along Asbury Road. The configuration would allow Hales Mill Road to be expanded to dual left-turn lanes, should growth warrant the additional capacity.

C1-2. Traffic Signal at Radford Road

This alternative would add traffic signal controls to the intersection of Asbury Road at Radford Road, in addition to the second eastbound lane along Asbury Road through both study intersections. The Hales Mill Road intersection would remain with its current one-way stop control. A lane schematic of this improvement alternative is shown in Figure 4-5.

The schematic is for lane configuration purposes only. It is not intended to account for all potential geometric impacts.

Figure 4-5, Traffic signal at Radford Road with two eastbound lanes on Asbury Road

Table 4-4 shows the traffic analysis for the projected 2029 volumes.

Table 4-4, 2029 Projected Operations, Traffic Signal at Radford Road Intersection with Two Eastbound Lanes on Asbury Road

Intersection	Peak Hour	Parameters	West Approach			East Approach			South Approach			North Approach		
			LT	TH	RT	LT	TH	RT	LT	TH	RT	LT	TH	RT

	PM	LOS	B	A		A						F	C	
		Delay (s)	10.3	0.0		0.0						195.5	16.0	
		Queue (ft)	25	0		0						225	25	

¹ LOS source: HCM 6th Edition, Signalized Intersections

² LOS source: HCM 6th Edition, Unsigned Intersections

Queue represents 95th percentile queue per lane, 25-feet per vehicle

Under projected traffic for 2029, all approaches are expected to operate at LOS C or better in both peak hours at the Radford Road intersection. Expected queue lengths are not projected to impact adjacent intersections.

Expected operations at the Hales Mill Road intersection may see slight improvements, but not enough to effectively improve the poor operations along Hales Mill Road. Depending on the ultimate timing of the proposed signal at Radford Road, additional benefits may be observed at the Hales Mill Road intersection, due to the ability to create gaps in traffic along Asbury Road.

The addition of the second eastbound lane, improved the operations so that queues are no longer extending from the Radford Road intersection to the Hales Mill Road intersection.

C1-3. Traffic Signal at Both Intersections

This alternative would add traffic signal controls to both of the Hales Mill Road and Radford Road intersections with Asbury Road, in addition to the second eastbound lane along Asbury Road. Due to the proximity of the intersections, both signals would need to operate in a coordinated fashion. The signal phasing plan would include protected/permissive left-turns along Asbury Road. No lane changes are proposed. A lane schematic of this improvement alternative is shown in Figure 4-7.

Figure 4-7, Traffic signal at both intersections with two eastbound lanes on Asbury Road

Table 4-5 shows the traffic analysis for the projected 2029 volumes.

Table 4-5, 2029 Projected Operations, Traffic Signal at Radford Road and Hales Mill Road Intersections with Two Eastbound Lanes on Asbury Road

Intersection	Peak Hour	Parameters	West Approach			East Approach			South Approach			North Approach

		LOS	A	A		A						E	D	
		Delay (s)	2.7	4.2		2.2						60.8	49.3	
		Queue (ft)	25	225		600						175	25	

LOS source: HCM 6th Edition, Signalized Intersections

Queue represents 95th percentile queue per lane, 25-feet per vehicle

Under projected traffic for 2029 at the Radford Road intersection, all approaches are expected to operate at LOS B or better, except for the northbound left and right lanes, which are expected to operate at LOS D in both peak hours. Queues are not expected to cause spillback issues between the intersections.

At the Hales Mill Road intersection, all approaches are expected to operate at LOS C or better in both peak hours, except for the southbound left and right lanes in the PM peak hour. The southbound left-turn movement is expected to operate at LOS E and the right-turn at LOS D. Queues are not expected to cause spillback issues between the intersections.

C2. Alternative LT2, Realign Hales Mill Road and Radford Road into One Intersection

These long-term alternatives are meant to be changes that would have the highest costs, due to the most significant geometric impacts. Solutions would target the 2039 horizon year and beyond.

These alternatives involve realigning Radford Road, Hales Mills Road, or both, as they intersect Asbury Road, as shown in Figure 4-8, Figure 4-9, and Figure 4-10. Control options considered for the realigned intersections include a traffic signal and a multilane roundabout.

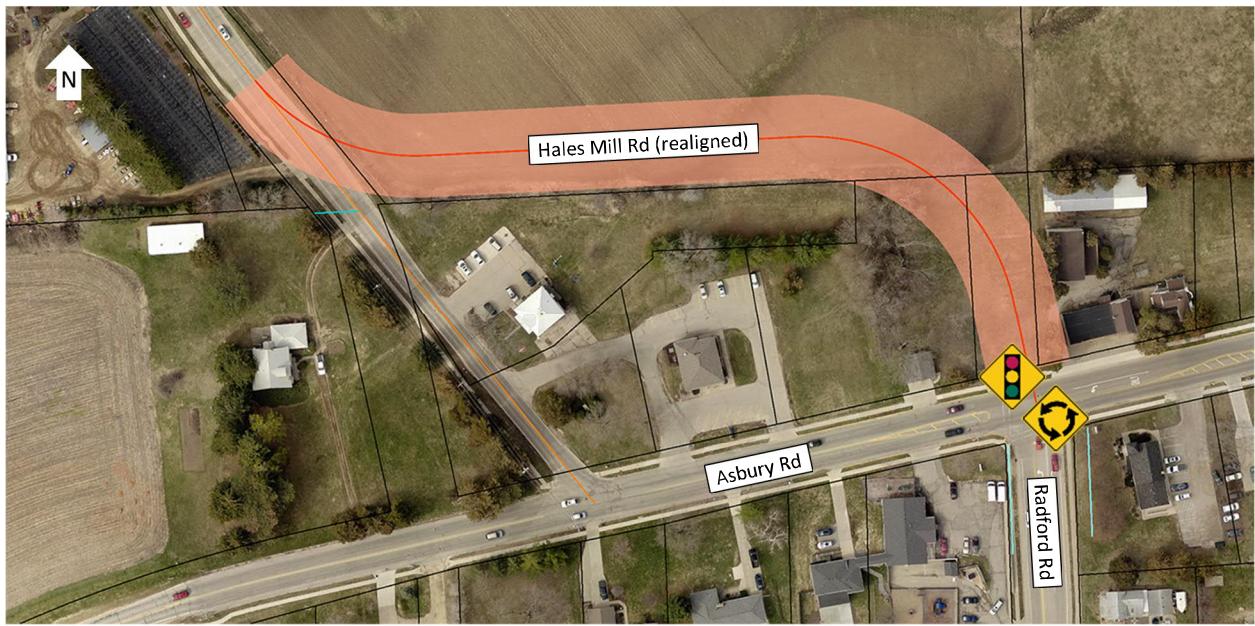

Figure 4-8, Realignment of Hales Mill Road, Alternative 1

Figure 4-9, Realignment of Hales Mill Road and Radford Road, Alternative 2

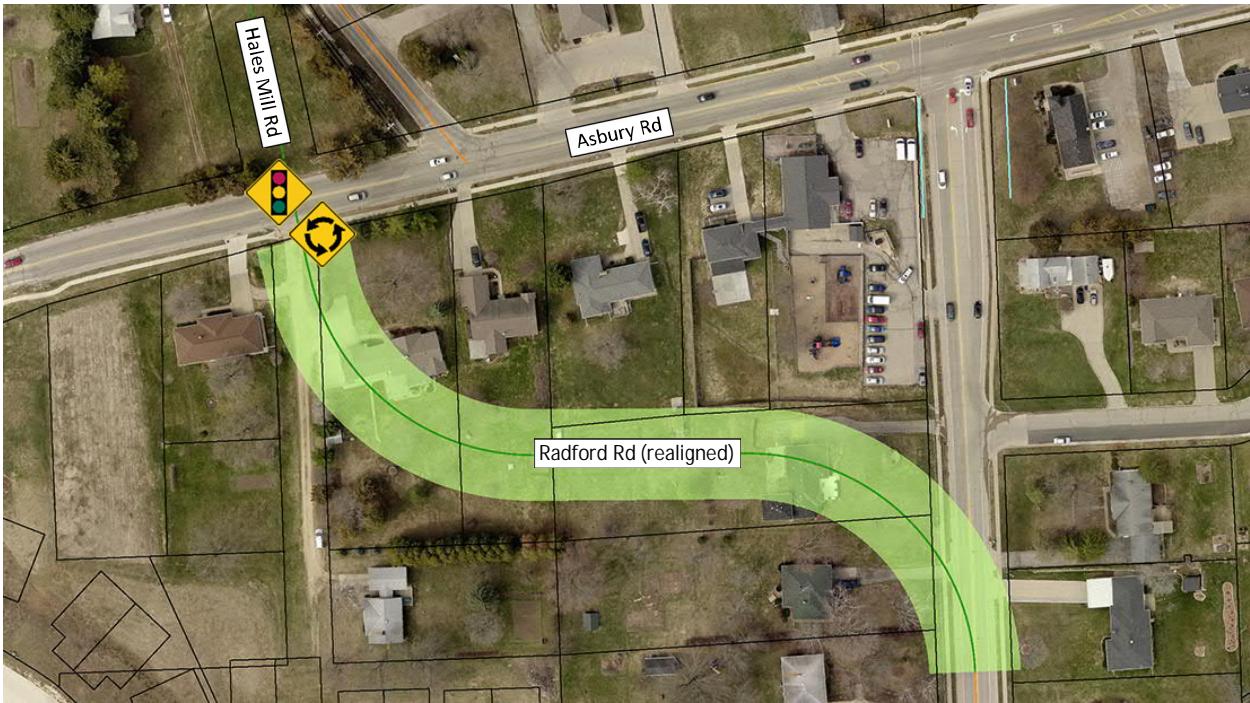

Figure 4-10, Realignment of Radford Road, Alternative 3

Cost estimates were assembled for each of the three realignment alternatives. Table 4-6 shows the anticipated costs for each realignment alternative. These costs included real estate costs based on current appraisal values plus inflation along with expected road construction costs. Expecting that this large of an improvement may take years for the City to implement, costs were established in 2029 dollars, using a 3% inflation rate.

Table 4-6, Realignment Cost Estimate

Realignment Alternative	Real Estate Cost	Construction Cost	Total Cost
Realign Hales Mill Road (Alt. 1)	\$ 0.6M – 1.6M	\$ 1.4M – 1.8M	\$ 2.0M – 3.4M
Realign Hales Mill Road and Radford Road (Alt. 2)	\$ 2.2M – 2.7M	\$ 1.8M – 2.3M	\$ 4.0M – 5.0M
Realign Radford Road (Alt. 3)	\$ 1.0M – 1.7M	\$ 1.3M – 1.8M	\$ 2.3M – 3.5M

The City should develop more accurate cost estimates if choosing to further pursue one of the realignment options.

C2-1. Realignment with Multilane Roundabout

This alternative would create a multilane roundabout at the intersection one of the three realignment alternatives shown earlier in this section. The design is versatile to allow expansion of the Asbury Road approaches into two lanes when operations warrant, allowing for the smallest impacts along the Asbury Road corridor.

Two approach lanes would enter the roundabout from the east and west, along Asbury Road. The approaches from Hales Mill Road and Radford Road would only need to be single-lane approaches, utilizing traffic projections to 2039 and beyond.

A summary of the operational analysis is shown in Table 4-7.

Table 4-7, Projected Operations, Multilane Roundabout with Realigned Roadways

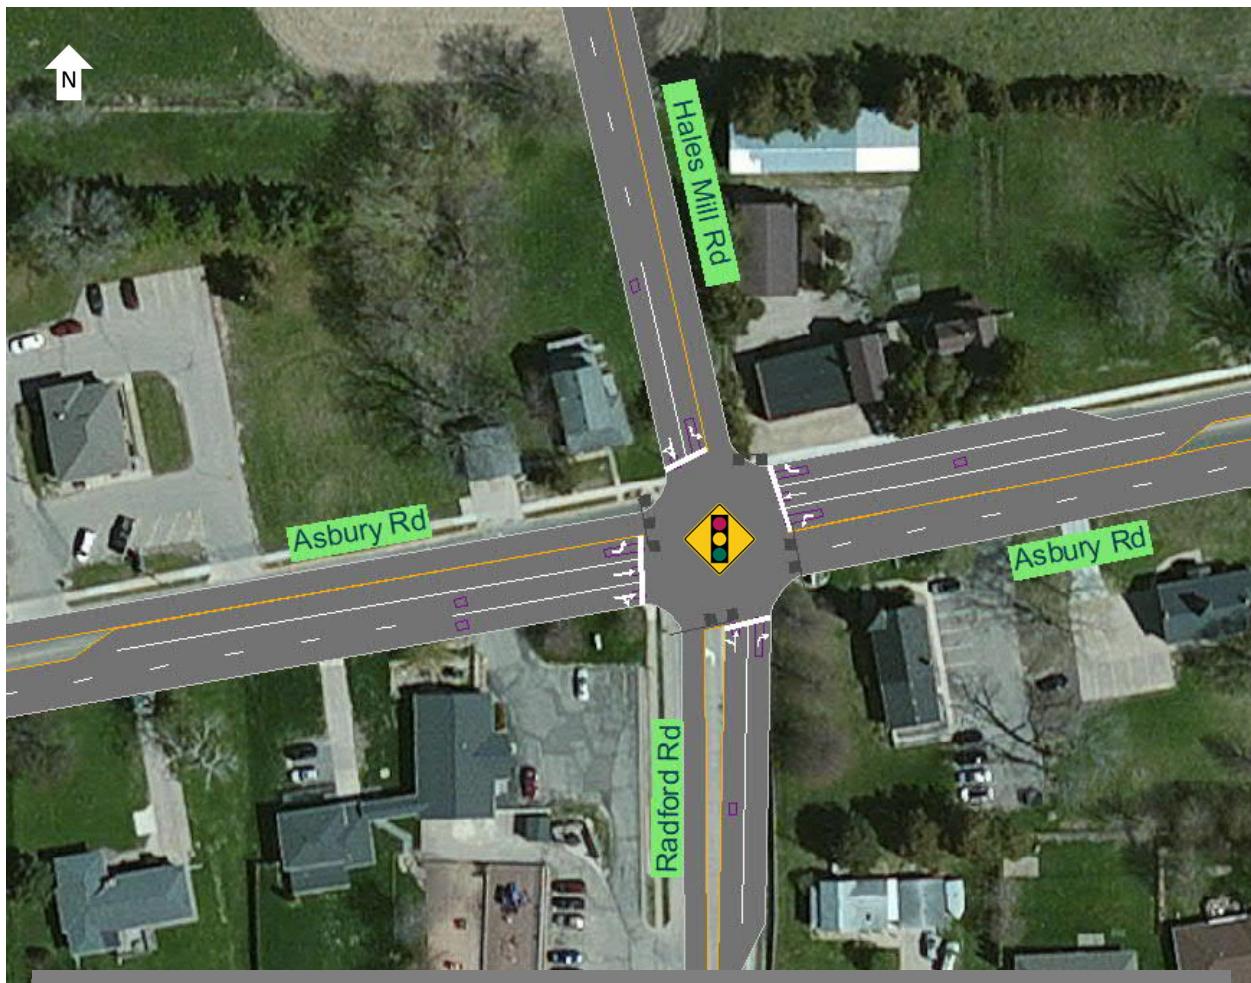

Year	Peak Hour	Parameters	West Approach			East Approach			South Approach			North Approach		
			LT	TH	RT	LT	TH	RT	LT	TH	RT	LT	TH	RT
2029	AM	Lanes	1 LT/TH	1 TH/RT		1 LT/TH	1 TH/RT		1-Shared			1-Shared		
		LOS	A	A		A	A		B			A		
		Delay (s)	5.5	5.5		2.8	2.8		12.8			6.5		
	PM	Queue (ft)	25	25		25	25		100			75		
		LOS	A	A		A	A		A			A		
		Delay (s)	3.7	3.7		5.9	5.9		7.1			8.1		
2039	AM	Queue (ft)	50	50		50	50		75			50		
		Lanes	1 LT/TH	1 TH/RT		1 LT/TH	1 TH/RT		1-Shared			1-Shared		
		LOS	A	A		A	A		C			A		
	PM	Delay (s)	7.7	7.7		3.0	3.0		21.8			8.4		
		Queue (ft)	50	50		50	50		200			75		
		LOS	A	A		A	A		A			B		
LOS source: HCM 6 th Edition, Unsignalized Intersections Queue represents 95 th percentile queue per lane, 25-feet per vehicle														

Under projected 2029 traffic, all approaches are expected to operate at LOS B or better in for both peak hours. No significant queues are anticipated in either peak period.

Using projected 2039 traffic, all approaches are expected to operate at LOS C or better in for both peak hours. No significant queues are anticipated in either peak period.

C2-2, Realignment with Traffic Signal with Two Eastbound Lanes

This alternative would implement a traffic signal at the intersection one of the three realignment alternatives shown earlier in this section. This control option requires two eastbound lanes along Asbury Road. Dedicated turn lanes would need to be provided for the eastbound, westbound, and southbound left-turn movements, and the northbound and westbound right-turn movements. Protected/permissive phasing would be used for left-turn movements along Asbury. A lane schematic of this improvement alternative is shown in Figure 4-11.

The schematic is for lane configuration purposes only. It is not intended to account for all potential geometric impacts.

Figure 4-11, Traffic signal with realigned roadways and two eastbound lanes on Asbury Road

If the City chose to pursue this alternative, consideration should be given to expanding to two westbound lanes as well as two eastbound lanes. For traffic operations as analyzed in this study, two westbound lanes are not necessary. However, when undertaking a construction project of this magnitude the City would be prudent to consider other unknowns. Further, while costs were shown above for the realignment options, costs have not been determined for the expansion of Asbury Road. There are too many variables to consider that are outside the scope of this study. Asbury Road could be widened north, south, or on both sides which all will require differing costs based on the real estate impacts. If this alternative is considered further, the City should look at all alternatives to determine the most cost effective solution.

A summary of the operational analysis is shown in Table 4-8.

Table 4-8, Projected Operations, Traffic Signal with Realigned Roadways and Two Eastbound Lanes on Asbury Road

Year	Peak Hour	Parameters	West Approach			East Approach			South Approach			North Approach

LOS source: HCM 6th Edition, Signalized Intersections
 Queue represents 95th percentile queue per lane, 25-feet per vehicle

Under projected 2029 traffic, all approaches are expected to operate at LOS C or better in for both peak hours. Queues are expected to be acceptable in both peak periods.

Using projected 2039 traffic, all approaches are expected to operate at LOS C or better in for both peak hours, with the exception of the westbound left-turn movement in the AM peak hour. That movement is expected to operate at LOS D. Queues are expected to be acceptable in both peak periods.

Chapter 5 – CONCLUSION & RECOMMENDATIONS

Improvement alternatives established for the Radford Road at Asbury Road intersection by themselves will not solve all the issues identified in the corridor. Instead, many of these alternatives create unintended additional issues with operation at the Hales Mill Road intersection. With modifications, alternatives do exist, which are able to address the operational concerns at both of the study intersections.

Alternatives that address the corridor are split into short and long-term improvement horizons. Short-term improvements can be implemented faster and for generally less cost, but will require the corridor to be readdressed at a later date. The short-term alternatives are summarized in Table 5-1.

Table 5-1, Short-term Improvements

Alternative	Pros/Cons	Expected Longevity	Cost
1 Traffic Signal at Hales Mill Road with Minor Geometric Improvements	<ul style="list-style-type: none">Better overall corridor operations than a traffic signal alone at Radford RoadHas the ability to create gaps for Radford trafficDoes not solve operational issues at RadfordImproved operations for westbound through movementEastbound approach to Hales Mill Road intersection nearing capacity	2029	Low
2 Traffic Signals at Both Intersections with Existing Lanes/Geometry	<ul style="list-style-type: none">Slight operational improvements for both intersectionsSignals must be coordinated which limits timing optionsOperations and queues worsen along Asbury Road	2029	Low

Long-term improvements will require more planning and time to implement. They will come with a higher cost, due to the length of the project and expected ROW costs, but should allow the corridor to operate acceptably for a significantly longer period of time. Long-term alternatives are summarized in Table 5-2.

Table 5-2, Long-term Improvements

Alternative	Pros/Cons	Expected Longevity	Cost
1A* Traffic Signal at Hales Mill Road	<ul style="list-style-type: none"> • Improvements to corridor operations – acceptable operations and queue lengths • Has the ability to create gaps for Radford Traffic • Does not solve operational issues at Radford Road 	2035 – 2040	Med – High
1B* Traffic Signal at Radford Road	<ul style="list-style-type: none"> • Improvements to corridor operations – acceptable operations and queue lengths • Does not solve operational issues at Hales Mill Road 	2035 – 2040	Med – High
1C* Traffic Signal at Both Intersections	<ul style="list-style-type: none"> • Improvements to corridor operations – acceptable operations and queue lengths • Signals must be coordinated which limits timing options 	2035 – 2040	High
2A Combined Intersection with Multilane Roundabout	<ul style="list-style-type: none"> • Improvements to corridor operations – acceptable operations and queue lengths • Requires ROW acquisition and relocations • Highest expected longevity due to built-in capacity • Could accommodate single or two-lane approaches along Asbury Road, as volumes warrant 	2040 – 2050 +	High
2B* Combined Intersection with Traffic Signal	<ul style="list-style-type: none"> • Improvements to corridor operations – acceptable operations and queue lengths • Requires ROW acquisition and relocations • Highest expected longevity due to built-in capacity • Needs the most amount of lanes 	2050 +	Highest

* Includes second eastbound lane along Asbury Road

Based on the summary, the best and lowest cost alternative in the short-term is to install a traffic signal at the Hales Mill Road intersection when warrants are met, as this intersection has the worst overall intersection operations. Radford Road would also gain some operational benefit as well via gaps created by the traffic signal. In the interest of long-term growth and capacity, realigning the intersections into a single intersection creates the most long-term capacity, but it does come at the highest price due to ROW needs. It also has the greatest opportunity for safety benefits, as it significantly reduces the number of conflict points by combining the two intersections into a single intersection.

Of the long-term alternatives, the realignment to combine the Hales Mill Road and Radford Road intersections into one intersection is the best alternative to allow for future traffic growth. The roundabout has the most flexibility, as it does not require immediate expansion to additional lanes along Asbury Road. However, when undertaking a project of the magnitude necessary, it may be best to expand Asbury Road at the same time. If Asbury Road is expanded to four-lanes, the traffic signal will likely provide better operations farther into the future than the roundabout. The City should make a decision on a realignment alternative, or do a more in-depth study of the realignment alternatives, to determine which is the most cost effective. Further, that study should also explore the alternatives of expanding Asbury Road to 4-lanes and the costs and impacts associated with that improvement. After

the completion of that study, the City should move forward with pursuing a long term plan for realignment into a single intersection with a multi-lane roundabout or a traffic signal. Either control option will provide acceptable operations well into the future.

Intersection	1856	3.3		0.975		20.9	LOS C	33.5	850.9				

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Roundabout LOS Method: Same as Sign Control.

Lane LOS values are based on average delay and v/c ratio (degree of saturation) per lane.

LOS F will result if v/c > 1 irrespective of lane delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all lanes (v/c not used as specified in HCM 6).

Roundabout Capacity Model: SIDRA Standard.

SIDRA Standard Delay Model is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option is selected.

Gap-Acceptance Capacity: SIDRA Standard (Akcelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Intersection	1856	3.3		0.916		12.1	LOS B	23.0	583.0				

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Roundabout LOS Method: Same as Sign Control.

Lane LOS values are based on average delay and v/c ratio (degree of saturation) per lane.

LOS F will result if v/c > 1 irrespective of lane delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all lanes (v/c not used as specified in HCM 6).

Roundabout Capacity Model: SIDRA Standard.

SIDRA Standard Delay Model is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option is selected.

Gap-Acceptance Capacity: SIDRA Standard (Akcelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

^d Dominant lane on roundabout approach

Intersection	1856	3.3		0.612		2.5	LOS A	5.2	133.1				

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Roundabout LOS Method: Same as Sign Control.

Lane LOS values are based on average delay and v/c ratio (degree of saturation) per lane.

LOS F will result if v/c > 1 irrespective of lane delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all lanes (v/c not used as specified in HCM 6).

Roundabout Capacity Model: SIDRA Standard.

SIDRA Standard Delay Model is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option is selected.

Gap-Acceptance Capacity: SIDRA Standard (Akcelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

⁶ Lane under-utilisation due to downstream effects

^d Dominant lane on roundabout approach

Intersection	2138	3.3		0.700		3.2	LOS A	7.5	190.4				

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Roundabout LOS Method: Same as Sign Control.

Lane LOS values are based on average delay and v/c ratio (degree of saturation) per lane.

LOS F will result if v/c > 1 irrespective of lane delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all lanes (v/c not used as specified in HCM 6).

Roundabout Capacity Model: SIDRA Standard.

SIDRA Standard Delay Model is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option is selected.

Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

⁶ Lane under-utilisation due to downstream effects

^d Dominant lane on roundabout approach

Traffic Signal Warrant Analysis

Traffic Signal Warrant Summary Worksheet

100%

The Worksheet(s) attached are provided as an attachment to the Engineering Investigation Study for:

Intersection: Asbury Rd & Hales Mill Rd

County: Dubuque

City: Asbury, Iowa

Major Street: Asbury Rd

Minor Street: Hales Mill Rd

Critical Approach Speed: 35 mph

Critical Approach Speed: 25 mph

Lanes: 1 lane

Lanes: 2 or more lanes

% Right Turns Included

In built-up area of isolated community of < 10,000 population? No

From North (SB) 0%

Total number of approaches at intersection? 4 or more

From East (WB) 100%

If it is a "T" intersection, inflate minor threshold to 150%? No

From South (NB) 100%

Manually set volume level? No

From West (EB) 100%

Analysis based on EXISTING volume data.

Date	Day of the Week	Time (HH:MM)			
		From	AM / PM	To	AM / PM
5/15/2019	Wednesday	6:00	AM	6:00	PM

Warrant Evaluation Summary		Warrant Met:
Warrant 1: Eight - Hour Vehicular Volume		No
Condition A: Minimum Vehicular Volume		No
Condition B: Interruption of Continuous Traffic		No
Condition C: Combination: 80% of A and B		No
Warrant 2: Four-Hour Volume		No
Warrant 3: Peak Hour Volume		N/A
Warrant 4: Pedestrian Volume		N/A
Criterion A: Four-Hour		
Criterion B: Peak-Hour		
Warrant 5: School Crossing		N/A
Warrant 6: Coordinated Signal System		N/A
Warrant 7: Crash Experience		No
Warrant 8: Roadway Network		N/A
Warrant 9: Intersection Near a Grade Crossing		N/A

Warrant Analysis Conducted By:

Name: EKJ

Agency: MSA Professional Services

Date: 1/3/2019

Warrant 1: Eight - Hour Vehicular Volume

100%

Warrant Evaluated? Yes

Condition A :		
Min. Veh. Volume		
Volume Level	100%	80%
Major Rd. Req	500	400
Minor Rd. Req	200	160
Number of Hours	1	1

Satisfied? No

Warrant Satisfied? No

Manually Set To:

6:00 AM

Enter Start Time (Military Time) (HH:MM)

Time Period	From	To	Major Road: Both App. (VPH)	Minor Road: High App. (VPH)	Total
1	6:00	7:00	489	142	631
2	7:00	8:00	906	250	1156
3	8:00	9:00	751	140	891
4	9:00	10:00	569	83	652
5	10:00	11:00	566	85	651
6	11:00	12:00	743	78	821
7	12:00	13:00	769	107	876
8	13:00	14:00	743	85	828
9	14:00	15:00	818	107	925
10	15:00	16:00	1101	112	1213
11	16:00	17:00	1235	117	1352
12	17:00	18:00	1284	114	1398
13	18:00	19:00	0	0	0

15	20:00	21:00	0	0	0
16	21:00	22:00	0	0	0

Condition B:

Interruption of Continuous Traffic

Condition B:		
Interruption of Continuous Traffic		
Volume Level	100%	80%
Major Rd. Req	750	600
Minor Rd. Req	100	80
Number of Hours	7	8

Satisfied? No

Condition C:

Combination of A & B at 80%

Satisfied? No

Warrant 2: Four-Hour Volume

100%

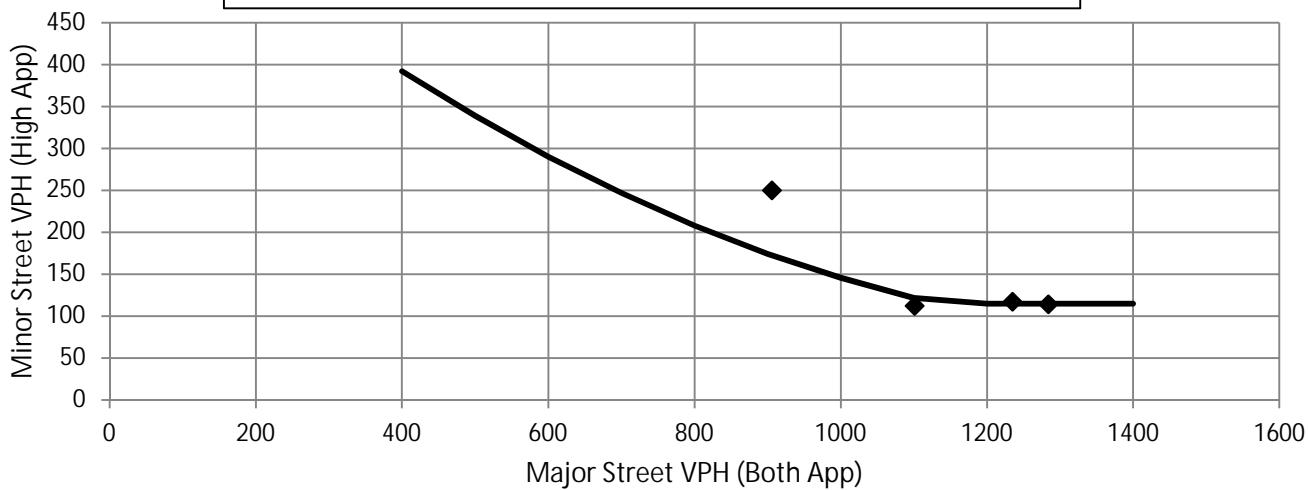

Warrant Evaluated? Yes

Warrant Satisfied? No

Manually Set To:

Hour Start	16:00	7:00	17:00	15:00
Major Road Vol.	1235	906	1284	1101
Minor Road Vol.	117	250	114	112

Figure 4C-1 Warrant 2, Four-Hour Vehicular Volume

Warrant 3: Peak Hour Volume

100%

Warrant Evaluated? No

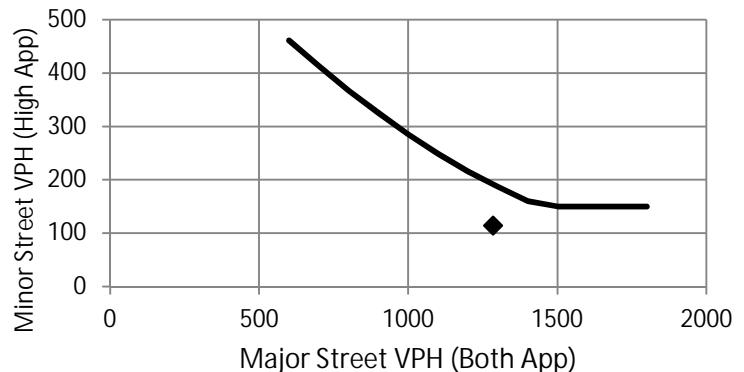

Condition justifying use of warrant:

Criteria	Met?
Delay on Minor Approach	5
Volume on Minor Approach	150
Total Entering Volume (veh/h)	800

Warrant Satisfied? N/A

Manually Set To:

Figure 4C-3 Warrant 3, Peak Hour

Manually Set Peak Hour? No

Peak Hour	Major Road Vol. (Both App.)	Minor Road Vol. (High App.)
17:00	1284	114

Warrant 4: Pedestrian Volume

100%

Warrant Evaluated? No

Warrant Satisfied? N/A

Manually Set To:

Criterion A: Four Hour

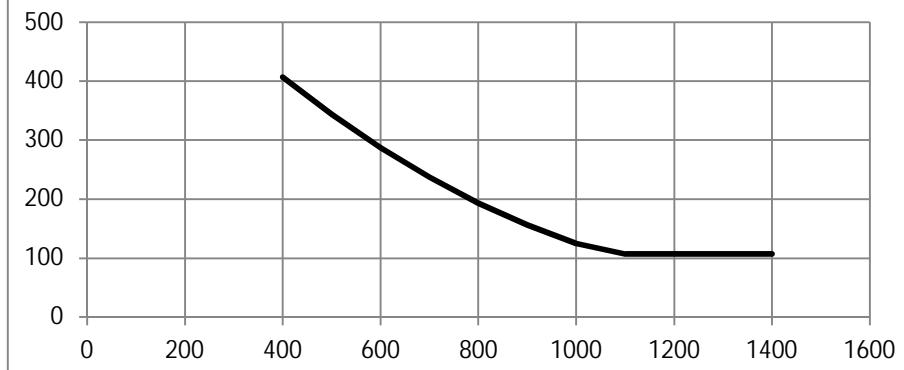

Hour (Start)	Pedestrian Volume	Major Road Vol.
		0
		0
		0
		0

Manually Set Major Rd Vol?

Avg. walk speed less than 3.5 ft/s?

Criterion A Satisfied?

Figure 4C-5 Warrant 4, Pedestrian Four-Hour Volume

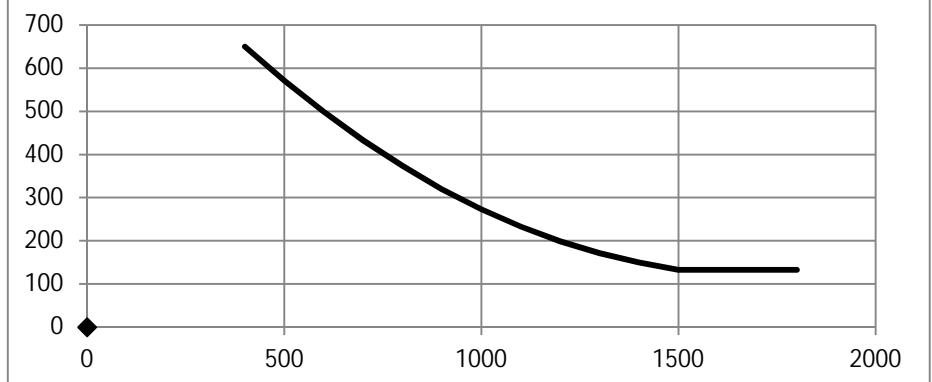

Criterion B: Peak Hour

Peak Hour	Pedestrian Vol.	Major Road Vol.
0:00	0	0

Criterion B Satisfied?

Figure 4C-7 Warrant 4, Pedestrian Peak Hour

Warrant 5: School Crossing

100%

Warrant Evaluated? No

Warrant Satisfied? N/A

Manually Set To:

Fulfilled?

Criteria

1	There are a MINIMUM of 20 school children during the highest crossing hour.	
2	There are fewer adequate gaps in the major road traffic stream during the period when the school children are using the crossing than the number of minutes in the same period.	
3	The nearest traffic signal along the major road is located more than 300 ft away. Or, the nearest traffic signal is within 300 ft but the proposed traffic signal will not restrict the progressive movement of traffic.	

Warrant 6: Coordinated Signal System

100%

Warrant Evaluated? No

Warrant Satisfied? N/A

Manually Set To:

Fulfilled?

Criteria

1	Signal spacing > 1000 ft	
2	On a one-way road or a road that has traffic predominantly in one direction, the adjacent signals are so far apart that they do not provide the necessary degree of vehicle platooning.	
3	On a two-way road, adjacent signals do not provide the necessary degree of platooning and the proposed and the adjacent signals will collectively provide a progressive operation.	

Warrant 7: Crash Experience

100%

Warrant Evaluated? Yes

Warrant Satisfied? No

Manually Set To:

Fulfilled?

Criteria

1	Adequate trial of other remedial measures has failed to reduce crash frequency. Measures Tried:		No
2	Five or more reported crashes, of types susceptible to correction by signal, have occurred within a 12 month period.	# of crashes per 12 months 3	
3	Warrant 1, Condition A (80%)	No	Yes
	Warrant 1, Condition B (80%)	Yes	
	Warrant 4, Criterion A (80%)	No	
	Warrant 4, Criterion B (80%)	Yes	

Warrant 8: Roadway Network

100%

Warrant Evaluated? No

Warrant Satisfied? N/A

Manually Set To:

Fulfilled?

Criteria

1	Total entering volume of at least 1,000 veh/h during typical weekday peak hour		1398	Yes	No
	Five-year projected volumes that satisfy one or more of Warrants 1, 2, or 3.			No	
2	Total entering vol. of at least 1,000 veh/h for each of any 5 hrs of non-normal business day (Sat. or Sun.)	Hour			
		Volume			

Characteristics of Major Routes - Select yes if all intersecting routes have characteristic

Fulfilled?

1	Part of the road or highway system that serves as the principal roadway network for through traffic flow	
2	Rural or suburban highway outside of, entering, or traversing a city	
3	Appears as a major route on an official plan	

Warrant 9: Intersection Near a Grade Crossing

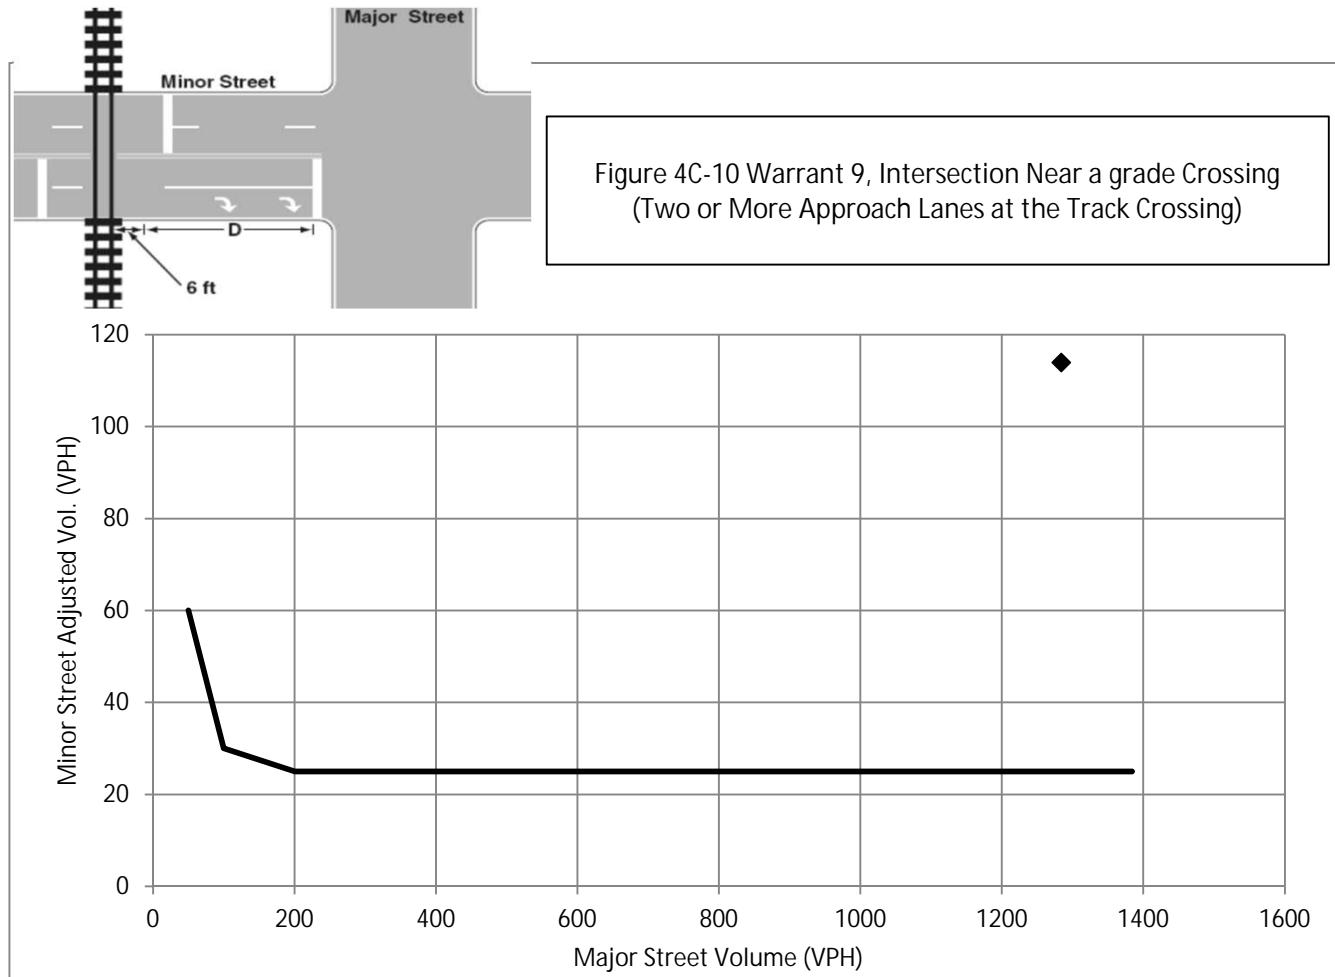

100%

Warrant Evaluated? No

Warrant Satisfied? N/A

Manually Set To:

Adjustment Factors			Manually Set Peak Hour?				
Rail Traffic per Day	% High Occupancy Buses on Minor Road	% Tractor-Trailer Trucks on Minor Road	D	Peak Hour	Major Road Vol.	Minor Road Vol.	Adjusted Minor Vol.
				17:00	1284	114	114

Conclusions/Comments:
